Allgemeines

WINMOR wurde als digitales ARQ Übertragungsprotokoll [1] für die Verwendung mit dem Winlink2000 (WL2K) [2] Netzwerk konzipiert. Mit WINMOR entfällt die Notwendigkeit kostspieliger, externer, PACTOR Modem-Hardware. Allerdings wird WINMOR nie die Leistungsfähigkeit von PACTOR 3 erreichen können (Datendurchsatz/Betriebssicherheit). WINMOR wurde auf der ARRL/TAPR Digital Communications Conference in Chicago, September 26-28, 2008 erstmals präsentiert.

Abstract:
The improving computational performance of PCs and the near real-time response of PC operating systems now make it feasible to implement reasonable performance HF ARQ messaging protocols suitable for digital messaging. While Pactor (I, II, III) currently dominate and generally represent the best available performance, PC sound cards with appropriate DSP software can now begin to approach Pactor performance at lower cost than dedicated hardware HF modems. This paper covers the on-going development of an optimized sound card mode WINMOR, compatible with the popular Winlink 2000 message system[1,2,3]. This effort leverages a prior feasibility project by the author in the evaluation of SCAMP [4], an adaptation of RDFT for digital messaging systems. The paper reviews the development effort of **WINMOR** (**WIN**link **M**essage **O**ver **R**adio) from motivation through tool development, programming, testing and deployment in the WL2K system.

Key Words:
Winlink 2000, WINMOR, ARQ protocols, multi-carrier PSK, Sound Card Modes, Pactor, SCAMP, HF Channel Simulators

Motivation:
The PC, widely available DSP tools, well designed sound card/radio interfaces and improving amateur software skills have yielded a variety of sound card modes over the last several years. These modes range from simple DSP/software implementation of RTTY through complex streaming applications like Win DRM. It is one of the few remaining areas where amateurs can and do experiment. Many of the modes developed however are a replacement of existing "chat" modes or "broadcast" modes where absolute accuracy is not a requirement or data is limited to plain ASCII text. Today, however, a viable message system (with the need for compression and binary attachments) requires true "error-free" delivery of binary data. To achieve this there must be some "back channel" or *ARQ* (*A*utomatic *R*etry re*Q*uest) so the receiving station can notify the sender of lost or damaged data and request retransmission or repair. HF Pactor (I, II, III) has served us well in this regard providing good performance (net bits/sec/ Hz bandwidth) and robustness. However the proprietary nature of high performance Pactor modems (Pactor II, III) can be cost prohibitive especially in applications such as emergency communications where wide deployment coupled with low average usage make it difficult to justify the investment in high performance but costly hardware. As developers of Winlink 2000 we are continually asked to supply a lower cost of entry than Pactor for those needing to access the WL2K system on HF.

WINMOR ist keine Software, sondern ein Protokoll, es gibt jetzt zwei Programme in der Entwicklung, die dieses Protokoll verwenden:

- **RMSExpress** ein Benutzer-Client-Programm
- **RMS-HF**, ein Radio-Message-Server als Teil des WL2K Systems.
